

Full-Site SEO Audit Service

User Guide

An AI-powered full health-check tool for your website

Diagnose technical issues + Evaluate content quality + Generate fix
recommendations

Version 4.7

1. What is this?

This is an AI-powered SEO audit tool. You only need to provide a website URL, and the system completes the following steps in a single session (no cross-session waiting):

Crawl your site: Simulate the Google crawler view and analyse pages one by one. In this version each run covers at most 50 pages — pick from 10 / 20 / 50.

Technical SEO audit: Check 50 common technical issues (titles, descriptions, structured data, page performance, etc.) and rank them by P0 / P1 / P2 priority.

Content quality evaluation: Score representative pages on 7 dimensions (topical relevance, structure, evidence, depth, GEO readiness, visuals, copy).

GSC data integration (optional): If you can provide Google Search Console data, the report will incorporate search-performance analysis.

2. What do you need to prepare?

Required:

Your website URL (e.g. <https://www.yourwebsite.com>).

Optional (significantly increases report value):

A Google Search Console CSV export (queries, impressions, clicks, position). If you have Google BigQuery, the system can also pull GSC data automatically.

3. How does the process work?

The whole service runs to completion in the same conversation, with progress streamed live. You will not be asked to wait until the next turn for results.

Step	What happens
Step 1	You provide the URL, pick the crawler (Googlebot PC or Mobile), and pick the scale (10 / 20 / 50 pages)
Step 2	The system wipes the previous run and re-crawls the site (progress streamed live)
Step 3	The system generates 4 deliverables in one pass
Step 4	You receive 4 files with diagnostic findings and fix recommendations

4. What will you receive? (4 files in total)

1. URL Inventory (Excel)

Every URL that took part in this audit. Each row is one URL; columns include basic facts (status code, title, word count, etc.) plus a hit flag (1 = issue / 0 = clean) for every one of the 50 technical SEO dimensions, the total hit count, and a summary of the top issues. This is the raw evidence behind every conclusion in the reports.

2. Technical SEO Report (PDF)

A full technical health check: executive summary → issue overview (P0/P1/P2) → detailed diagnosis with 5 example URLs per issue and concrete fix suggestions → remediation roadmap.

3. Content Quality Report (PDF)

7-dimension scoring (topical relevance, structural clarity, evidence, depth, GEO readiness, visual richness, copy quality), per-page grade (A/B/C/D), issue list, improvement directions, and priority roadmap.

4. Full-Site SEO Audit User Guide (PDF)

The document you are reading now. It is re-generated for every audit so its description always matches the options you actually used this time.

5. How to read the reports

Quick scan:

1. Start with the health score (out of 100) on the Technical SEO report cover.
2. Skim the issue overview table to see all P0 emergencies.
3. Open the remediation roadmap to know what to fix first.

Deep read:

1. Sort the URL inventory by hit count to locate the worst-performing pages.
2. Walk through each issue in the Technical SEO report — description, scope, example URLs, fix steps.
3. In the Content Quality report, focus on pages graded C/D and address each weak dimension.

6. FAQ

[Q: Will the crawler affect my site?](#)

No. The crawler is read-only and emulates the Google crawler. Each run covers at most 50 pages, so the load on your server is minimal.

[Q: Why only Googlebot PC and Googlebot Mobile?](#)

This version is focused on Google-ranking scenarios, so only the two Google crawlers are available. If you want to compare both perspectives, run the audit twice — each run is fully isolated.

[Q: Why is the page scale capped at 50?](#)

This version optimises for "fast, precise, repeatable", so the scale is consolidated to 10 / 20 / 50. Fifty pages already cover a representative slice of any site and let the entire flow finish in one conversation.

[Q: Will the previous audit affect this one?](#)

No. Before each run the system wipes every intermediate artefact (crawl results, sampling data, issue analysis, report PDFs). Every number in this run comes from data generated in this run only.

[Q: What do the priority labels mean?](#)

P0 (red / critical): directly hurts ranking or UX — fix this week.
P1 (yellow / moderate): noticeable SEO impact — fix this month.
P2 (green / minor): improvements for the next quarter.

[Q: Why is there no Word \(DOCX\) version?](#)

This version standardises on PDF + Excel: PDFs keep the layout stable for the two reports, Excel keeps the URL inventory filterable. You can still copy text out of the PDFs if you need to edit.

[Q: Can I provide GSC data for a richer report?](#)

Yes. Log in to Google Search Console → Performance → export as CSV and share the file.
